Functions and Signals

INHIBIT signal (connector J2, pin G)

The **INHIBIT** signal is used to turn the power supply ON and OFF.

To turn the power supply ON, leave pin G open.

To turn the power supply OFF, short pin G to pin F.

If not used, leave pin G unconnected.

This signal is referenced to **INHIBIT RTN (connector J2, pin F)**

PWR GOOD signal (connector J2, pin D)

The **PWR GOOD** signal indicates the status of the output voltage.

When output voltage rises above $95\% \pm 5\%$ of its nominal value, pin 10 will be pulled down to pin 13 through a $49.9\ \Omega \pm 1\%$ resistor and a phototransistor.

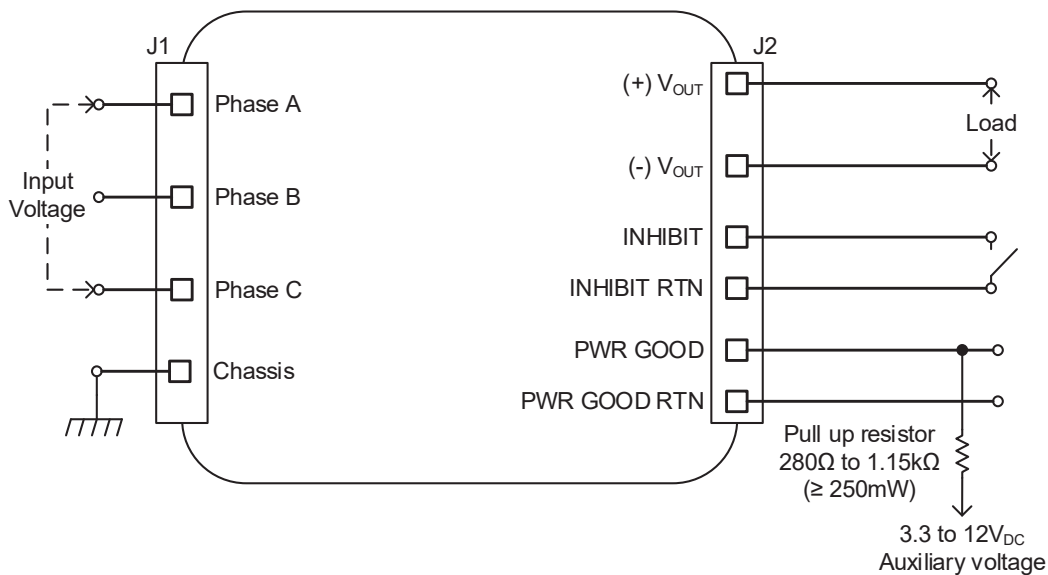

When output voltage falls below $90\% \pm 5\%$ of its nominal value, pin 10 will be in high impedance mode.

If not used, leave the signal unconnected.

This signal is referenced to **PWR GOOD RTN (connector J2, pin E)**

Both pins 10 and 13 are isolated from all other parts of the circuitry.

Typical Connection Diagram

Note: PWR GOOD pull-up resistor and auxiliary voltage shown in this diagram are typical values. The system designer must select the actual values such that no damage can occur to the internal components of the power supply – **consult factory for more information.**
